

COOPERATIVE ECONOMIC INSECT SURVEY REPORT
Glenn A. Salsbury, Survey Entomologist

Report 12, Volume 57
October 1, 2009

LOCUST BORER: Borers are now active. Goldenrod flowers are a good place to look for the adults. This longhorned beetle is an important pest of honey locust.

REDHEADED ASH BORER: One adult was caught in a trap within the past two weeks.

CAROLINA SAWYER: Only two females have emerged so far from white pine logs that had been collected earlier. The latest one emerged about the 29th of September. One of the logs was split into small pieces and only large larvae were present. No beetles have been caught in traps so far this fall.

RED OAK BORER: One adult was caught in a canopy trap during the past two weeks.

ASPARAGUS BEETLES: Adults and larvae can still be found on asparagus.
